

## CLAIM AMENDMENTS

Claim 1 (Original). A merchandising track device for displaying articles, said track device comprising:

first and second elongate track members formed separately as two discrete structures, said first and second  
5 members being connected together in an end-to-end, longitudinally adjacent relationship, each of said members comprising a track base for carrying articles for sliding movement along said each member, and at least one article-guiding side wall upstanding from said track base of said  
10 each member and extending along said each member, said one side wall of said first member being disposed in general longitudinal alignment with said one side wall of said second member and including a portion extending upwardly above an upper edge of said one side wall of said second  
15 member, said one side wall of said second member having a cutout opening to said upper edge thereof and to opposite side surfaces thereof;

locking means integrally formed with said first member for interconnecting said one side wall of said first  
20 member and said one side wall of said second member to lock said members in position relative to each other, said locking means comprising a flexible overhang extending rearward from said portion of said one side wall of said first member and disposed over said upper edge of said one  
25 side wall of said second member, said flexible overhang engages side of said one side wall of said second member with a lug formed integrally with said overhang and received in said cutout, whereby longitudinal displacement of said one side wall of said first member relative to said one side  
30 wall of said second member is prevented; and

a pair of engaging tabs provided disposed respectively alongside said opposite side surfaces of said one side wall of said second member with at least one of said engaging tabs formed on said lug so that lateral  
35 displacement of said one side wall of said first member relative to said one side wall of said second member is prevented.

Claim 2 (Original). A merchandising track device for displaying articles, said track device comprising:

an elongate body having a forward end, said body comprising a track base for carrying a row of articles for  
5 sliding movement along said body, a tongue extending forwardly from said track base and defining said forward end of said body, and at least one article-guiding side wall upstanding from said track base and extending along said body;

10 a front piece formed as a discrete structure separate from said body and attached to said forward end of said body to provide a stopper for preventing a leading article in said row from exiting said track device, said front piece comprising a deck for supporting said leading  
15 article, at least one upright wall upstanding from said deck and disposed in general longitudinal alignment with said one side wall, said one upright wall including a portion extending upwardly above an upper edge of said one sidewall; and locking means for interconnecting said one upright wall  
20 and said one side wall to lock said front piece in position relative to said body, said locking means including a flexible overhang integrally formed with said front piece and extending rearward from said portion of said one upright wall and disposed over said upper edge of said one side wall

25 with said flexible overhang flexing to either side of said  
one side wall of said second member; and  
a pair of engaging tabs disposed respectively  
alongside opposite side surfaces of said one side wall, at  
least one of said engaging tabs being integrally formed with  
30 said overhang, whereby lateral displacement of said one  
upright wall relative to said one side wall is prevented,  
and wherein one sidewall has a cutout opening to said upper  
edge and said opposite side surface thereof, and at least  
one engaging tab is formed on a lug to engage in said  
35 cutout.

Claim 3 (Original). The track device according to  
claim 2, wherein said lug has a thickness greater than a  
thickness of said one side wall, and both said engaging tabs  
are formed on said lug.

5

Claim 4 (Original). The track device according to  
claim 2, wherein said tongue is provided with a hooking  
element projecting therefrom, and said deck has a strip  
portion having a front and rear opposed faces, said front  
5 face providing an edge for engaging said hooking element to  
prevent forward displacement of said front piece with  
respect to said body, said rear face sloping to facilitate  
insertion of said tongue into said socket.

Claim 5 (Original). The track device according to  
claim 4, wherein said engaging edge of said deck extends  
transversely of said body.

Claim 6 (Original). The track device according to  
claim 5, wherein said strip portion is provided by said  
lower wall and extends transversely of said body, said rear

face of said strip portion sloping downwardly and  
5 rearwardly, said hooking element projecting downwardly from  
a lower surface of said tongue.

Claim 7 (Original). The track device according to  
claim 4, wherein said tongue is formed with at least one  
notch for dividing said tongue into plural portions so that  
one of said plural portions exhibits substantial  
5 flexibility, and said one of said plural portions is  
provided with said hooking element.

Claim 8 (Original). The track device according to  
claim 2, wherein said engaging tabs are disposed with a  
lateral gap therebetween to receive in said gap an edge of  
said one sidewall.

5 Claim 9 (Original). The track device according to  
claim 8, wherein said engaging tabs are opposed to each  
other across a thickness of said one side wall.

Claim 10 (Original). The track device according to  
claim 8, wherein said engaging tabs are disposed at  
positions offset from each other along a length of said one  
side wall.

5 Claim 11 (Original). The track device according to  
claim 2, wherein said body and said front piece are formed  
from different material.

Claim 12 (Original). The track device according to  
claim 11, wherein said body is molded of polystyrene, and  
said front piece is molded of polycarbonate.

Claim 13 (Original). The track device according to claim 2, wherein said tongue is formed with at least one notch for dividing said tongue into plural portions so that one of said plural portions exhibits substantial flexibility, and said one of said plural portions is provided with said hooking element.

Claim 14 (Original). A merchandising track device for displaying articles, said track device comprising:

first and second elongate track members formed separately as two discrete structures, said first and second members being connected together in an end-to-end, longitudinally adjacent relationship, each of said members comprising a track base for carrying articles for sliding movement along said each member, and at least one article-guiding side wall upstanding from said track base of said each member and extending along said each member, said one side wall of said first member being disposed in general longitudinal alignment with said one side wall of said second member and including a portion extending upwardly above an upper edge of said one side wall of said second member, said one side wall of said second member having a cutout opening to said upper edge thereof and to opposite side surfaces thereof;

said second member comprising a tongue extending longitudinally from said track base of said second member, said tongue defining an end of said second member, said first member having an end-opening socket for receiving said tongue so that said track bases of said first and second members are interconnected, said tongue being formed on said track base of said second member such that an upper surface of said tongue is disposed below an upper surface of said track base of said second member to allow said upper surface

of said track base of said second member and an upper surface of said track base of said first member to form a continuous floor for slidably supporting said articles, wherein said track base of said first member comprises upper and lower opposed walls, and said socket is defined between said upper and lower walls; and

locking means integrally formed with said first member for interconnecting said one side wall of said first member and said one side wall of said second member to lock said members in position relative to each other, said locking means comprising a flexible overhang extending rearward from said portion of said one side wall of said first member and disposed over said upper edge of said one side wall of said second member with said flexible overhang flexing to either side of said one side wall of said second member, and a lug with tabs formed integrally with and extending from said overhang and received in said cutout, whereby longitudinal displacement of said one side wall of said first member relative to said one side wall of said second member is prevented.

Claim 15 (Original). The track device according to claim 14, wherein said tongue is provided with a hooking element projecting therefrom, and said track base of said first member has a strip portion having a front and rear opposed faces, said front face providing an edge for engaging said hooking element to prevent longitudinal displacement of said first member with respect to said second member, said rear face sloping to facilitate insertion of said tongue into said socket.

Claim 16 (Original). A merchandising track device for displaying articles, said track device comprising:

an elongate body having a forward end, said body comprising a track base for carrying a row of articles for sliding movement along said body, a tongue extending forwardly from said track base and defining said forward end of said body, and at least one article-guiding side wall upstanding from said track base and extending along said body; and

10 a front piece formed as a discrete structure separate from said body and attached to said forward end of said body to provide a stopper for preventing a leading article in said row from exiting said track device, said front piece comprising a deck for supporting said leading article, said deck having a socket for receiving said tongue so that said deck and said track base are interconnected, said tongue being formed on said track base such that an upper surface of said tongue is disposed below an upper surface of said track base to allow said upper surface of said track base and an upper surface of said deck to form a continuous floor for slidably supporting said articles, at least one upright wall upstanding from said deck and disposed in general longitudinal alignment with said one side wall, said one upright wall including a portion extending upwardly above an upper edge of said one sidewall; and locking means integrally formed with said front piece for interconnecting said one upright wall with said one side wall to lock said front piece in position relative to said body, said locking means including a flexible overhang extending rearward from said portion of said one upright wall and disposed over said upper edge of said one side wall having said cutout, said flexible overhang flexing to either side of said one side wall of said second member; and

a pair of engaging tabs disposed respectively alongside opposite side surfaces of said one side wall in a

cutout with at least one of said engaging tabs being integrally formed with said overhang so that lateral displacement of said one upright wall relative to said one side wall is prevented.

40

Claim 17 (Original). The track device according to claim 16, wherein said tongue is provided with a hooking element projecting therefrom, and said deck has a strip portion having front and rear opposed faces, said front face providing an edge for engaging said hooking element to prevent forward displacement of said front piece with respect to said body, said rear face sloping to facilitate insertion of said tongue into said socket.

10

Claim 25 (New). A front panel assembly for a merchandising display track device, said track device being adapted to receive a row of articles for sliding movement therealong, said front panel assembly, comprising:

5 a base adapted to receive said row of articles from said track device for sliding movement therealong;

a first upstanding vertical member having a top end portion, a bottom end portion and a front edge, said first vertical member being permanently connected along its bottom end portion to said base;

10 a first face member connected to said front edge of said first vertical member, said first face member extending laterally a preselected distance from said first vertical member toward said second vertical member;

15 a second upstanding vertical member having a top end portion, a bottom end portion and a front edge, said second vertical member being laterally spaced from said first

vertical member and permanently connected along its bottom end portion to said base;

20           a second face member connected to said front edge of said second vertical member, said second face member extending laterally a preselected distance from said second vertical member toward said first vertical member;

25           an elongate connecting member having a first end connected to said top end portion of said first vertical member and a second end portion connected to said top end portion of said second vertical member, said connecting member curving outwardly away from said vertical members; and

30           means for detachably attaching said front panel assembly to said track device.

Claim 26 (New).           A front panel, as set forth in claim 18, wherein said first and second face members are connected to said base.

Claim 27 (New).           A front panel assembly for a merchandising display track device, said track device having a track base adapted to receive a row of articles for sliding movement therealong and a vertical member extending  
5   along said track base, said vertical member having a cutout opening to an upper edge thereof and to opposite side surfaces thereof, said front panel assembly, comprising:

          a floor deck adapted to receive said row of articles from said track base for sliding movement therealong;

10           means for detachably attaching said floor deck to said track base;

          a first upstanding vertical member having a top end, a bottom end portion and a front edge, said first vertical

member being permanently connected along its bottom end  
15 portion to said floor deck;

a second upstanding vertical member having a top  
end, a bottom end portion and a front edge, said second  
vertical member being laterally spaced from said first  
vertical member and permanently connected along its bottom  
20 end portion to said floor deck;

an elongate connecting member having a first end  
connected to said top end of said first vertical member and  
a second end portion connected to said top end of said  
second vertical member, said connecting member curving  
25 outwardly away from said vertical members;

locking means integrally formed with one of said  
first and second vertical members for interconnecting said  
vertical member of said track device and said one vertical  
member to lock said vertical members in position relative to  
30 each other, said locking means comprising a flexible  
overhang extending rearward from said one vertical member  
and adapted to be disposed over said cutout so that said  
flexible overhang engages a side of said vertical member of  
said track device with a lug formed integrally with said  
35 flexible overhang and received in said cutout thereby  
preventing longitudinal displacement of said front panel  
assembly relative to said track; and

a pair of engaging tabs provided disposed  
respectively alongside said opposite side surfaces of said  
40 vertical member of said track device with at least one of  
said engaging tabs formed on said lug so that lateral  
displacement of said one vertical member relative to said  
vertical member of said track device is prevented.
